Company Profile:

W. L. Gore and Associates is a privately held multinational manufacturing company, known for their Gore-Tex fabric.

The Situation:

One of the Gore facilities is surrounded by mushroom farms. The manure used in the mushroom farms has a distinct odor and to make matters worse the gases associated with that smell corrode the silver and other metals being used within the facility.

The facility was using carbon filtration but the filters were not lasting long and were very costly.

The Action:

General Aire brought in one of our partnering manufacturers that is a global leader in carbon filtration. A recommendation was made and a demonstration was offered in one of the sites HVAC units. The demonstration was set up to show the correct carbon blend would last longer than what was currently being used.

The Result:

The site changed all their units to the filters General Aire recommended with great success. At a lower up front cost the carbon filters are outlasting the previous filters by 3x.
